

STRUCTURAL CONCRETE

Get it right the first time - always important, but **absolutely essential** when placing concrete. Concrete is very unforgiving. Once it is placed, there is nothing that can be done to correct mistakes made prior to the placement. Therefore, an **experienced concrete contractor** is extremely important when it is time to place concrete for your project.

Our engineers and field supervisors have the knowledge, experience, and equipment needed to complete your structural concrete project. Our staff of civil and structural engineers will prepare the plans for your project, or we can use the plans prepared by your engineer - the choice is yours. Our concrete pumping equipment allows us to make each pour quickly and efficiently, and our trained field supervisors will ensure that the placement is completed as specified in the plans and that the conditions are right to ensure that the concrete cures properly. With no margin for error, take no chances - call Robinson with your next concrete project.

Robinson Construction has placed hundreds of thousands of cubic yards of concrete including the following types of structures:

- Reinforced slabs
- Walls
- Beams
- Columns
- Foundations
- Frames
- Basins
- Footings

"The concrete work on these press pits is some of the best that DANA has ever received. The Superintendent and Project Manager did a terrific job on this project."

Program Solutions Group, DANA Plant, Hopkinsville, Kentucky

"We at Florence & Hutcheson are very appreciative of the quality of work and leadership shown by Robinson Construction on this project."

Florence & Hutcheson, Paducah McCracken JSA, Paducah, Kentucky
